Lesotho Farmers Registration System (FRS)

Comprehensive User Guide

Ministry of Agriculture, Food Security and Nutrition (MAFSN), Kingdom of Lesotho

Version 1.1 — August 2026

Table of Contents

1. Introduction

1.1 What this system is

The **Farmers Registration System (FRS)** — also referred to as the **Farmers Portal** or the **Agricultural Subsidy Management System (ASMS)** — is the digital platform used by the **Ministry of Agriculture, Food Security and Nutrition (MAFSN)** of the Kingdom of Lesotho to register farmers, capture their land parcels, manage agricultural subsidy programmes, evaluate applications for eligibility, control the budget that funds those subsidies, and distribute farm inputs (such as seed and fertiliser) to beneficiaries through a voucher system.

In plain terms, the system answers four questions for the Ministry:

1. **Who are our farmers, and where do they farm?** (Registration)
2. **Who qualifies for a given subsidy programme, and who decides?** (Applications and review)
3. **Can we afford it, and where did the money go?** (Budget)
4. **Did the farmer actually receive the inputs they were entitled to?** (Inputs Management and vouchers)

1.2 The standard it follows (GovStack RegBB)

The FRS is built as an implementation of the **GovStack Registration Building Block (RegBB)**. *GovStack* is an international set of standards for building reusable digital-government services, and a *Building Block* is one reusable component of that standard. The *Registration Building Block* is the component that deals with registering people (or, here, farmers) and processing their applications for a government service or benefit.

The practical consequence of following this standard is that the system is **configuration-driven**: a new subsidy programme can be added by an administrator filling in configuration screens (the "metamodel" — see Section 5.7), rather than a software

developer writing new program code. This makes the platform flexible and reusable across different agricultural programmes.

1.3 The technology, at a glance

The FRS runs on **Joget DX** — a low-code application platform. You do not need to know anything about Joget to *use* the system; this guide describes everything in terms of the screens you see. The only Joget concepts worth knowing as a user are that the navigation is organised into **categories** (the collapsible groups in the left-hand menu) and **menus** (the individual screens inside each category). This guide uses the word **module** for a category and **screen** for a menu.

1.4 Who uses the system

The FRS is used by several types of staff, each with a defined **role** that controls which modules they can see and what they can do. The five roles are the System Administrator, the District Supervisor, the Field Officer, the Finance Officer, and the Analyst. Roles are explained in full in **Section 3**.

2. Getting Started

2.1 Accessing the system

Open a modern web browser (Google Chrome, Mozilla Firefox, or Microsoft Edge) and go to the address of your FRS server. On a local installation this is typically `http://localhost:8077/jw`; on a shared server it will be an address provided by your administrator. You will be taken to a **login page**.

2.2 Logging in

Enter your **username** and **password** and select **Login**. Your account is created for you by the System Administrator, who also assigns your role. If you cannot log in, contact your administrator — do not share accounts, because the system records **who** performed every action (see *Audit Trail* in the glossary).

2.3 The layout of the screen

After logging in you land on the **App Center / Home**. Once inside the Farmers Registration app you will see three main areas:

- **The top bar** — shows the app name and logo on the left, and on the right your name (e.g. “Admin Admin”) with a drop-down for signing out. A **TEST MODE** badge may appear here: it indicates the system is running on non-production (practice) data. Never treat TEST MODE data as real.
- **The left navigation menu** — the list of **modules** (Dashboard, Registration Forms, MOA Office, Budget, Inputs Management, Reports, MM-Configuration, Admin, Master

Data). Selecting a module expands it to show its **screens**. You will only see the modules your role permits.

- **The content area** — the large central panel where the selected screen is displayed.

2.4 Working with list screens

Most screens show a **list** (a table) of records — for example, the list of registered farmers. A list screen has these common elements:

- **Page-size selector** (e.g. "20") — how many rows to show per page.
- **Filter/search boxes** (e.g. District, National ID, Mobile) — type a value and select **Show** to narrow the list.
- **Column headers with sort arrows** — select a header to sort by that column.
- **The New button** — opens a blank form to create a new record.
- **Row actions** — selecting a row (or its edit icon) opens that record for viewing or editing; a checkbox column allows selecting several rows for a bulk action.
- **Pagination controls** — move between pages when there are many records.

If a list shows "Nothing found to display", it means no records match the current filter — clear the filters and select **Show** again. (If a list is unexpectedly empty even without filters, see **Section 10, Troubleshooting**.)

2.5 Working with form screens

Creating or editing a record opens a **form**. Forms may be split into **tabs** (for example, the subsidy application is a multi-tab wizard). Fields marked as required must be completed before the form will save. Use **Save** (or **Submit**) to store your work and **Cancel** to discard it. Some fields auto-fill: for instance, entering a farmer's **National ID** on an application automatically pulls in that farmer's name and district from the registry (this is done by the *Identity Resolver* — see the glossary).

3. Roles and Permissions

Every user is assigned one or more **roles** (in Joget these are called *groups*). A role determines which **modules** appear in your left-hand menu and what you are allowed to do. The FRS defines five roles.

Role (technical id)	Title	What this person typically does
`role_sysadmin`	System Administrator	Full access to every module. Configures programmes and master data, manages users and API keys, oversees notifications, and supports all other users.

Role (technical id)	Title	What this person typically does
`role_district_supervisor`	District Supervisor	Oversees registration and applications for a district. Sees dashboards, registration forms, the MOA Office review queue, and inputs management.
`role_field_officer`	Field Officer	Front-line staff at district and centre level. Registers farmers and parcels, captures applications, and redeems vouchers at resource centres.
`role_finance_officer`	Finance Officer	Manages and monitors the budget. Sees dashboards, the full Budget module, and financial reports.
`role_analyst`	Analyst	Configures the service definition and reference data. Works in the MM-Configuration and Master Data modules.

How to read this: if a module or screen described later in this guide does not appear in your menu, it is because your role does not grant access to it — this is by design. The table below summarises which roles can open each module.

Module	Sysadmin	District Supervisor	Field Officer	Finance Officer	Analyst
Dashboard	✔	✔		✔	
Registration Forms	✔	✔	✔		
MOA Office	✔	✔			
Budget	✔			✔	
Inputs Management	✔	✔	✔		
Reports	✔	✔		✔	
MM-Configuration	✔				✔
Admin	✔				

Module	Sysadmin	District Supervisor	Field Officer	Finance Officer	Analyst
Master Data	✔				✔

The **System Administrator** is a super-user and can additionally access administrative functions of the underlying platform (managing users, plugins and system settings) that are outside the scope of this guide.

4. Core Concepts

This section explains the foundational terms used throughout the FRS. Read it once; the rest of the guide assumes these meanings. A shorter alphabetical glossary of every term and acronym appears in **Section 9**.

4.1 People and places

- **Farmer** — an individual registered in the system, identified uniquely by their **National ID (NID)**. The farmer's core record holds their name, contact details, demographics and residency.
- **Household** — the family unit a farmer belongs to, including household members and their relationship to the farmer. Household composition (e.g. dependants, orphanhood, disability) can affect eligibility and targeting.
- **National ID (NID)** — the citizen's national identity number. It is the master key that ties a farmer to their parcels, applications, vouchers and entitlements, and it is used to auto-fill identity details on new records.
- **Parcel** (also **Plot** or **Farm**) — a piece of land a farmer cultivates. A parcel record captures its location (district and **agro-ecological zone**), size, and — where captured — its **GPS boundary** (the polygon drawn on a map). One farmer may have several parcels.
- **District** — one of Lesotho's ten administrative districts: Berea, Butha-Buthe, Leribe, Mafeteng, Maseru, Mohale's Hoek, Mokhotlong, Qacha's Nek, Quthing and Thaba-Tseka. District is used everywhere for targeting, filtering and reporting.
- **Agro-Ecological Zone (AEZ)** — a classification of land by its farming conditions (for example lowlands, foothills, mountains, Senqu River Valley). Combined with district (see **MD.95, District × Ecological Zone**), it is used to pre-position map coordinates and to target programmes.
- **Resource Centre** (also **Collection Point** or **Distribution Point**) — a physical location, such as an agricultural service point or depot, where farmers collect their subsidised inputs and where field officers redeem vouchers. There are around 80 such centres across the ten districts (Quthing's full list of community-council centres was added in August 2026).

4.2 Programmes, applications and decisions

- **Support Programme** (or **Programme**) — a subsidy scheme the Ministry runs, such as the **Input Subsidy Programme**, **Block Farming**, or **WAMP** (Wool and Mohair / Agricultural Marketing Programme). A programme defines who is eligible, what benefit is given, and from which budget it is funded.
- **Application** — a farmer's request to participate in a programme (for example the **2025 Subsidy Application**). An application moves through a defined series of **statuses** from Draft to a final decision (see Section 4.4 and Section 7).
- **Eligibility** — whether a farmer meets the conditions of a programme. Eligibility is checked against **rules** (see *Determinant*) and recorded per criterion as pass, fail, or not-applicable.
- **Determinant / Rule** — a configurable condition that the system evaluates automatically, expressed in the Ministry's rule language. Determinants are used for several purposes (eligibility checks, data-quality checks, decision routing) and are authored in the **MM-Configuration** module and audited to the **RegBB Evaluation Audit**.
- **Operator Review** — the step where a Ministry officer examines a submitted application, optionally adjusts the requested quantities, and records a **decision**.
- **Decision** — the officer's ruling on an application: Approved, Partially Approved, Conditionally Approved, Rejected, Pending Additional Information, Escalated, or Under Investigation (see **MD.31, Decision Type**).
- **Rejection Reason** — a standard, selectable reason recorded when an application is rejected (for example *Not in Target District*, *Incomplete Documentation*, *Program Budget Exhausted* — see **MD.32**).
- **Entitlement** — the concrete benefit a farmer is granted once approved: the specific input items and quantities, with their subsidy percentages and monetary values. An entitlement is issued with a code (for example `EN-XXXXXX`) and is the basis for issuing vouchers.
- **Case Note** — a free-text note an officer attaches to an application or farmer to record context, decisions or follow-ups. Case notes form part of the record's history.
- **Appeal** — a farmer's formal challenge to a decision. Appeals have their own lifecycle (Draft → Submitted → Acknowledged → Under Review → Resolved/Closed — see **MD.72**).

4.3 Inputs, vouchers and distribution

- **Input** — a physical agricultural item distributed under a programme, such as maize seed, NPK fertiliser or urea. Inputs are catalogued in master data (**MD.27, MD.44, MD.91**).
- **Supplier / Agro-Dealer** — a company or dealer that provides inputs to the programme. Suppliers are registered so their stock and performance can be tracked.
- **Inventory** — the stock of each input held at each resource centre, expressed as **quantity on hand**. Redeeming a voucher decreases the relevant inventory.
- **Stock Transaction** — a recorded movement of stock (a receipt into a centre, an issue out of it, or an adjustment). Stock transactions keep inventory accurate.

- **Allocation Plan** — the plan that assigns quantities of inputs to centres and beneficiaries for a campaign, before vouchers are issued.
- **Voucher** — an electronic entitlement to collect a specific quantity of an input at a specific resource centre. A voucher has a code (for example `VCH-YYYYMMDD-NNNN`) and moves through a lifecycle: **issued** → **redeemed** (or **cancelled** / **expired**). Vouchers link the entitlement (what the farmer was approved for) to the physical hand-over of goods.
- **Redemption** — the act of a farmer collecting their inputs at a resource centre. A field officer records the redemption on the **Redeem Voucher** screen. Redeeming a voucher does three things atomically (all together, or none): it flips the voucher status from *issued* to *redeemed*, it decreases the centre's inventory, and it writes a **redemption audit** record and the corresponding budget event.
- **Distribution Receipt** — the record confirming inputs were handed over, used for reconciliation at the end of a campaign.
- **Campaign / Agricultural Season** — a time-bounded distribution cycle (for example a planting season) against which allocations, vouchers and reconciliation are organised.

4.4 Budget and money

The **Budget Engine** enforces financial control so the Ministry never distributes more than it has funded. It works with a small number of concepts:

- **Budget Envelope** — a pot of allocated money for a specific programme and funding source. It has an **allocated** amount (the ceiling) and tracks how much of that ceiling has been committed and spent.
- **Funding Source / Donor** — where the money comes from. Donors include the **MAFSN Domestic Budget**, the **European Union (DG INTPA)**, the **World Bank (IDA)** and the **World Food Programme (WFP)** (see **MD.94**). One programme can be funded by several donors, each with a defined share.
- **Budget Event** — a single entry in the budget ledger. Events follow the money through its life. The system uses six event types:
  - **PRE_COMMITMENT** — money earmarked provisionally (e.g. when an application is being processed).
  - **RESERVATION** — money set aside for a specific approved entitlement.
  - **COMMITMENT** — money firmly committed when a voucher is issued (the Ministry has now promised these goods).
  - **EXPENSE** — money actually spent, posted when a voucher is redeemed and goods change hands.
  - **RELEASE_RESERVATION** / **RELEASE_COMMITMENT** — money freed back to the envelope when a reservation or commitment is cancelled (for example a cancelled or expired voucher).
- **General Ledger (GL)** — the complete, permanent list of budget events, from which every financial report is derived.

- **Beneficiary Subledger** — the per-farmer accounting view showing what has been committed and spent for each individual.
- **Variance** — the difference between what was allocated and what has been committed/spent; used to spot over- or under-utilisation.
- **Threshold Alert** — an automatic warning raised when an envelope's utilisation crosses a configured level (for example nearly exhausted).
- **Roll-forward** — carrying an envelope's unspent balance from one period into the next.

The typical flow of a single benefit through the budget is: **RESERVATION** (on approval) → **COMMITMENT** (on voucher issue) → **EXPENSE** (on redemption). If the benefit is cancelled at any stage, a matching **RELEASE** event returns the money.

4.5 Configuration and system concepts

- **Master Data (MD)** — the controlled lists of standard values used in drop-downs across the system, such as districts, crops, livestock types, document types and statuses. There are around 95 master-data catalogues, numbered **MD.01** to **MD.95** (see Section 8). Keeping master data correct is essential, because forms and rules reference these values.
- **Metamodel / MM-Configuration** — the set of configuration tables that *define the shape of a service* without programming: which institution owns it, which screens and fields it has, which documents it requires, which fees and benefits apply, and which rules govern it. This is the engine that makes the platform configuration-driven (see Section 5.7).
- **Registry** — the authoritative store of registered farmers and parcels.
- **Identity Resolver** — a helper that looks up a person by their National ID and automatically fills their identity fields on a new form, so officers do not re-key data that is already held.
- **Notification** — an automated message (email or other channel) sent to farmers or staff when something happens, for example when an application changes status. Notifications are driven by **templates** and processed through a **queue**.
- **Audit Trail** — the tamper-evident log of who did what and when. Every significant action (a status change, a decision, a redemption) is recorded, supporting accountability and investigation.
- **API Key** — a credential used by other computer systems (not people) to exchange data with the FRS securely. Managed by the System Administrator.
- **KPI (Key Performance Indicator)** — a headline number shown on the dashboard, such as *Farmers Registered* or *Budget Committed*.

5. The Modules (screen by screen)

This section walks through every module in the left-hand menu and explains each screen inside it. Remember that you will only see the modules your role permits (Section 3).

5.1 Dashboard

The Dashboard gives a live, read-only overview of the whole programme. It refreshes each time you open it.

- **Executive Overview** — the headline page. It shows eight **KPI tiles**: *Farmers Registered*, *Parcels Captured*, *Active Programmes*, *Applications Received* (with approval rate), *Vouchers Issued* (with % redeemed), *Vouchers Redeemed*, *Budget Committed*, and *Budget Expensed*. Below the tiles are charts — parcel registrations by month, applications by district and status, voucher status mix, and budget event activity — followed by a per-programme envelope table and a recent budget-activity feed. Each tile and chart is clickable and takes you to the underlying list.
- **District Map (compact)** — a summary map view of activity by district.
- **District Map (geographic)** — a true geographic map of Lesotho showing district-level metrics, useful for seeing coverage and gaps at a glance.

5.2 Registration Forms

This is where farmers, their land, and their applications are captured. It is the day-to-day workspace of Field Officers and District Supervisors.

- **01 – Farmer Registration Form** — creates and maintains the core farmer record. It captures, across grouped sections, the farmer's **basic information** (names, National ID, date of birth, gender, mobile, email), **location and residency** (district, agro-ecological zone, village), **agricultural activity**, **household members** and their relationships, **livestock**, and **income and existing support programmes**. Use **New** to register a farmer; use the list's filters (District, National ID, Mobile) to find an existing one.
- **02 – Parcel Registration** — records the land parcels belonging to a farmer: location, size (in the configured **area units**), classification, crop production, and, where available, the **GPS boundary** captured on a map. A farmer may have several parcels.
- **2025 Subsidy Application** — the application wizard a farmer (or an officer on their behalf) completes to apply for the 2025 input-subsidy programme. Entering the applicant's **National ID** auto-fills their identity from the registry. The wizard then guides the user through the applicant/programme selection, the **eligibility** criteria, the **benefit request** (the input items and quantities sought), a **declaration/signature**, and submission. On submission the application enters the review lifecycle (Section 6.3).
- **My Applications** — a farmer- or officer-facing list of applications already started or submitted, so their progress can be tracked.

5.3 MOA Office

"MOA" stands for **Ministry of Agriculture**. This module is the officer's back-office for reviewing applications and managing programmes. It is used by District Supervisors and the System Administrator.

- **Manage Support Program** — create and maintain the subsidy programmes themselves (their type, target group, benefit model, funding and eligibility). This is where a new programme is switched on.
- **2025 Subsidy Application — Operator Review** — the review queue. The officer opens a submitted application, examines the applicant's details and eligibility, may **adjust the approved quantity** per benefit line (the officer's figure takes precedence over the farmer's request), records a **decision** with a mandatory reason, and signs off. On approval the application flips to *Approved*, an **entitlement** is generated, and the appropriate **budget event** is fired.
- **RegBB Evaluation Audit** — a read log of every automated rule evaluation the system performed (eligibility, quality, routing), showing what was checked and the outcome. Use it to understand *why* the system reached a given result.
- **Add Case Note** — attach a note to a farmer or application to record context or follow-up actions.

5.4 Budget

The Budget module is the Finance Officer's cockpit for financial control. Every screen is a specific view of the budget ledger described in Section 4.4.

- **Budget — Envelope state** — the current state of each **envelope**: allocated, committed, expensed, and remaining, per programme and source. This is the primary "how much is left" screen.
- **Budget — Per-source breakdown** — the same figures split by **funding source / donor**, so you can see each donor's contribution and usage.
- **Budget — Recent ledger entries** — the latest **budget events** in chronological order.
- **Budget — Pending pipeline** — money that is provisionally earmarked (pre-commitments and reservations) but not yet committed or spent — i.e. what is "in the pipeline".
- **Budget — Variance report** — allocated-versus-actual variance, to highlight over- or under-utilisation.
- **Budget — Alerts** — active **threshold alerts** where an envelope has crossed a warning level.
- **Budget — Roll-forward** — the tool to carry unspent balances forward into the next period.
- **Budget — General Ledger** — the complete, permanent list of all budget events (the GL).
- **Budget — Donor disbursement** — tracking of funds disbursed by each donor against their commitments.
- **Budget — Manual adjustments** — a controlled, maker-checker screen for recording manual corrections to the budget. Because manual adjustments move money directly, they require a second person to approve (the person who records the adjustment cannot also approve it).

5.5 Inputs Management (IM)

Inputs Management is the supply-chain side of the programme: from suppliers and stock, through allocation and vouchers, to the physical hand-over of inputs and its reconciliation. It is used by Field Officers, District Supervisors and the System Administrator.

- **IM – Supplier** — register and maintain the suppliers / agro-dealers that provide inputs.
- **IM – Inventory** — the stock of each input at each resource centre (**quantity on hand**). This is what redemption draws down.
- **IM – Stock Transactions** — the log of stock movements (receipts, issues, adjustments) that keep inventory accurate.
- **IM – Allocation Plan** — assign quantities of inputs to centres and beneficiaries for a campaign, ahead of issuing vouchers.
- **IM – Vouchers** — the list of issued vouchers with their codes, quantities, allocated centre, farmer, expiry date and current status.
- **IM – Redeem Voucher** — the front-line screen used at a resource centre to record a farmer collecting their inputs. The officer enters the **voucher code** (typed or scanned from the farmer's phone), selects the **district and resource centre**, enters their own name as the **distribution agent**, and optionally a **quantity** for partial collection. Selecting **Confirm Redemption** validates the voucher (correct status, not expired, matching centre, sufficient stock) and, if all checks pass, atomically records the redemption, decrements inventory and posts the budget expense. The screen then shows the outcome — success (with a redemption code and the before/after voucher status and inventory) or a clear reason it was blocked (for example *insufficient stock*, *already redeemed*, *wrong point*, *expired*).
- **IM – Print Voucher Slip** — produces a printable slip for a voucher.
- **IM – Redemption Audit Log (admin)** — the read-only history of all redemptions, for oversight and reconciliation.
- **IM – Distribution Receipts** — the hand-over receipts used for end-of-campaign reconciliation.

5.6 Reports

The Reports module provides operational and financial reporting for Supervisors, Finance Officers and the System Administrator.

- **Overview** — a landing report summarising key figures.
- **List of Farmers** — the full registry of farmers as a report, with the joined details (name, contact, district, zone, village) for export and review.
- **IM — Dashboard KPIs** — the headline Inputs Management indicators in one place.
- **IM — Voucher utilisation by programme** — how many issued vouchers have been redeemed, per programme.
- **IM — Consumption by centre (30 days)** — recent input consumption at each resource centre.

- **IM — Supplier performance** — a comparison of suppliers.
- **IM — End-of-campaign reconciliation** — the reconciliation view that closes out a campaign (issued vs redeemed vs stock).
- **IM — Funding by donor** and **IM — Programme funding breakdown (per donor)** — financial reports that attribute funding and spending to each donor.
- **Report — Approval rates**, **Report — Voucher velocity**, **Report — Budget envelope** — analytical report pages with charts on, respectively, how applications are being decided, how quickly vouchers are being redeemed, and how each budget envelope is being consumed.

5.7 MM-Configuration (the metamodel)

This module is the heart of the platform's flexibility, used by the Analyst and System Administrator. "MM" stands for **Metamodel** — a set of tables that *describe* a government service so the system can generate its behaviour without new programming. Configure these tables correctly and a new subsidy programme comes to life; misconfigure them and the service will not behave as intended.

- **MM – Institution** — the government body that owns the service (e.g. MAFSN).
- **MM – Service** — the service itself (e.g. an input-subsidy service).
- **MM – Registration** — the registration process definition attached to a service.
- **MM – Screen** — the screens (forms/pages) that make up the service.
- **MM – Catalog** — reference catalogues used by the service.
- **MM – Rules** — the **determinant rules** that govern eligibility, data quality and decision routing. This is where the logic of "who qualifies" is expressed.
- **MM – Action** — the actions a service can perform.
- **MM – Required Document** — the documents an applicant must provide.
- **MM – Fee** — any fees associated with the service.
- **MM – Benefit** — the benefit(s) a successful applicant receives (the basis of an entitlement).
- **MM – Role** and **MM – Role Screen** — the roles in the service and which screens each role may use.
- **MM – Field** — the individual data fields on the service's screens.
- **Programme Funding (donor share)** — defines how each programme is funded across donors (their percentage shares).
- **Notification Templates** — the message templates used to notify applicants and staff on events.

5.8 Admin

The Admin module is restricted to the System Administrator and covers technical administration.

- **Manage API Key** — create and manage the **API keys** that let other systems exchange data with the FRS securely.

- **Form Creator** — an administrative utility for provisioning the application's forms.
- **Identity Resolvers** and **Resolver Field Maps** — configure the **Identity Resolver** (Section 4.5): which source record a National ID is looked up against, and which source fields map to which target fields on the form.
- **Audit Trail** — the system-wide log of who did what and when.
- **Notification Queue** — the queue of messages waiting to be sent, with their status.
- **Notification Dashboard** — an overview of notification activity and delivery.

5.9 Master Data

The Master Data module holds the controlled lists that populate drop-downs across the system, maintained by the Analyst and System Administrator. Each screen (**MD.01** to **MD.96**) is a simple list where you can add, edit or retire the standard values for one category — for example the list of **districts**, **crops**, **document types** or **application statuses**.

Why it matters: almost every form and rule references master data. If, say, a new resource centre opens, it must be added under **MD.37** before vouchers can be redeemed there; if a crop is missing from **MD.19**, it cannot be selected on a parcel. Change master data carefully and consistently — a value that is in use should be *retired*, not deleted, so historical records keep their meaning.

A complete, categorised reference of all 96 master-data catalogues is provided in **Section 8**.

6. Key Workflows (end to end)

This section ties the modules together into the everyday processes.

6.1 Registering a farmer

1. Open **Registration Forms → 01 – Farmer Registration Form** and select **New**.
2. Complete the farmer's basic information (National ID, names, date of birth, gender, contact), then their residency (see the note below), agricultural activity, household members, livestock, and income/existing support.
3. **Save**. The farmer now exists in the registry and can have parcels and applications attached to their National ID.

The residency page (page 2) — what changed in August 2026. Officers trained on the earlier screen should note four changes:

- **National ID** now accepts **exactly 12 digits, numbers only.** A value that is not 12 digits (or contains letters) is rejected on save. **Date of birth** — the farmer's and each household member's — can no longer be a future date, and the year list stops at the current year.
- **Resource Centre is now required** on the residency page, and the **Quthing** list is now the Ministry's official list of centres: **Quthing Distribution Centre** (the district office at Moyeni, shown at launch as *Quthing Service Office*), **Tlatlametsi**, **Mphaki**,

Makoae, **Koali**, **Qomoqomong** and **Tele** — the Ministry's six surveyed centres plus the district distribution centre. **Likhohlong** also remains selectable for the time being, because a parcel captured on launch day is still recorded against it; it will be withdrawn once that parcel is recorded at the centre it belongs to. **Eight in all.** The remaining community-council entries offered at launch (Matsatseng, Liphakoe, Ha Nkoebe, Tsatsane, Mkh'ono, Mokotjomela and Seforong) were withdrawn at the Ministry's request on 26 August 2026 and no longer appear in the list; records already captured against them are unaffected.

- **Owned and rented land are now two separate boxes** — *Owned Land (Hectares)* and *Rented Land (Hectares)* — and the system shows their sum automatically in *Owned + Rented (Total, Hectares)*. *Total Available Land* is still entered on its own, because a farmer's total can include communal or borrowed land that is neither owned nor rented.
- **Access to Services** now asks the **mode of transport for each service separately** (water source, primary school, livestock market, crops market, public transport, hospital, and the nearest service point), each paired with its **travel time in minutes**. The single "Mode of Transportation" question has been removed.
- A **"Capture location" button** on the residency page fills the latitude and longitude from the officer's device and shows the accuracy. It records **the position of the device at that moment** — use it at the farmer's homestead, not back at the office. Coordinates can always be typed or corrected by hand, and the button never blocks saving if the device has no signal or permission.

Declaration date (final page) is pre-filled with today's date and may be back-dated by up to seven days (to allow a paper form signed a few days earlier to be captured); a future date is rejected.

6.2 Registering a parcel

1. Open **Registration Forms → 02 – Parcel Registration** and select **New**.
2. Identify the owning farmer (by National ID), then capture the parcel's location, size, classification and crop production. Where a map is available, draw the parcel's **GPS boundary**.
3. **Save**. The parcel is linked to the farmer.

6.3 Applying for a subsidy and its review lifecycle

1. **Apply** — In **Registration Forms → 2025 Subsidy Application**, enter the applicant's National ID (identity auto-fills), choose the programme, complete the eligibility criteria and the requested benefit items/quantities, sign the declaration, and **Submit**. The application status becomes **Submitted**.
2. **Automated checks** — The system evaluates the eligibility and quality **rules**, recording the outcomes to the **RegBB Evaluation Audit**. The application may move through **Under Review**, **Eligibility Verification**, **Document Review** and **Field Verification** as appropriate.
3. **Operator review** — In **MOA Office → Operator Review**, an officer opens the application, optionally adjusts approved quantities, and records a **decision** with a

reason. If information is missing, the status becomes **Pending Information** and the applicant is notified.

4. **Outcome** — On approval the status becomes **Approved** and an **entitlement** (`EN-…`) is generated with the approved items, quantities, subsidy percentages and values; a **budget reservation** is made. On rejection the status becomes **Rejected** with a standard rejection reason. The applicant may lodge an **Appeal**.

6.4 Issuing and redeeming vouchers

1. **Allocate & issue** — Based on the approved entitlements and the **Allocation Plan**, **vouchers** are issued (each `VCH-…`), assigned to a resource centre with a quantity and expiry. Issuing a voucher fires a budget **COMMITMENT**.
2. **Collect** — The farmer goes to their resource centre. A Field Officer opens **Inputs Management → IM – Redeem Voucher**, enters the voucher code, selects the district and centre, and confirms.
3. **Redeem** — If the voucher is valid (right status, not expired, right centre, enough stock), the system atomically: sets the voucher to **Redeemed**, decrements the centre's **inventory**, writes a **redemption audit** record, and posts a budget **EXPENSE**. A redemption code is returned. If a check fails (e.g. *insufficient stock*), nothing changes and the reason is shown.
4. **Reconcile** — At the end of the campaign, **Distribution Receipts** and the **End-of-campaign reconciliation** report confirm that issued, redeemed and stock figures agree.

6.5 How money moves through the budget

For a single approved benefit, the budget events fire in this order: a **RESERVATION** when the entitlement is approved, a **COMMITMENT** when the voucher is issued, and an **EXPENSE** when the voucher is redeemed. If the voucher is later cancelled or expires before redemption, a **RELEASE_COMMITMENT** (or **RELEASE_RESERVATION**) returns the money to the envelope. Finance Officers watch these in the **Budget** module; every event lands permanently in the **General Ledger**.

7. Statuses and Enumerations (quick reference)

7.1 Application statuses (MD.22)

Status	Meaning
Draft	Started but not yet submitted.
Submitted	Sent for processing; awaiting checks.
Under Review	Being examined by the system/officer.
Eligibility Verification	Eligibility rules being confirmed.

Status	Meaning
Document Review	Supporting documents being checked.
Field Verification	Being verified in the field.
Pending Information	Held awaiting more information from the applicant.
Approved	Accepted; entitlement generated.
Rejected	Declined (with a rejection reason).
Benefit Issued	Benefit/voucher has been issued.
Completed	Fully processed and closed.
Withdrawn	Cancelled by the applicant.

7.2 Decision types (MD.31)

Approved · Partially Approved · Conditionally Approved · Pending Additional Information · Rejected · Escalated for Review · Under Investigation.

7.3 Common rejection reasons (MD.32)

Does Not Meet Eligibility Criteria · Incomplete Documentation · Invalid/Unreadable Documents · Not in Target District · Land Size Outside Range · Duplicate Application · Already Benefited from Similar Program · Data Conflicts with Records · Farm Could Not Be Verified · False Information Provided · Submitted After Deadline · No Response to Info Request · Program Budget Exhausted · Other.

7.4 Voucher statuses

Issued (created, awaiting collection) · Redeemed (collected) · Cancelled (voided before collection) · Expired (not collected before the expiry date).

7.5 Budget event types

PRE_COMMITMENT · RESERVATION · COMMITMENT · EXPENSE · RELEASE_RESERVATION · RELEASE_COMMITMENT (defined in Section 4.4).

7.6 Appeal statuses (MD.72)

Draft · Submitted · Acknowledged · Information Requested · Under Review · Escalated · Overdue · Resolved · Closed · Withdrawn.

8. Master Data Catalogue Reference (MD.01 – MD.95)

Every catalogue below is a controlled list of standard values, maintained under **Master Data** (Section 5.9). They are grouped here by theme for readability; the MD number is the identifier you will see on the menu.

8.1 People and demographics

MD	Catalogue	Purpose
MD.01	Marital Status	Farmer's marital status.
MD.02	Language	Preferred language.
MD.05	Residency Type	How/where the farmer resides.
MD.08	Education Level	Highest education attained.
MD.12	Relationship	Household member relationship to the farmer.
MD.13	Orphanhood Status	Orphan status (used in vulnerability targeting).
MD.14	Disability Status	Disability classification.
MD.35	Food Security Status	Household food-security classification.

8.2 Geography

MD	Catalogue	Purpose
MD.03	District	Lesotho's ten districts.
MD.04	Agro Ecological Zone	Farming zone classification.
MD.37	Resource Centre	Collection/distribution points (84 defined, 77 currently active).
MD.55	Geographic Scope	Scope of a programme (national, district, etc.).
MD.95	District × Ecological Zone	Valid district/zone combinations and map centroids.

8.3 Farming, crops and agronomy

MD	Catalogue	Purpose
MD.06	Farm Labour Source	Source of farm labour.
MD.07	Livelihood Source	Household livelihood source.

MD	Catalogue	Purpose
MD.09	Info Source	How the farmer receives agricultural information.
MD.10	Conservation Practice	Soil/water conservation practices used.
MD.11	Hazard	Environmental/agricultural hazards.
MD.15	Area Units	Units for parcel area (e.g. hectares).
MD.16	Livestock Type	Types of livestock.
MD.16.1	Livestock Category	Livestock categories.
MD.17	Income Source	Household income sources.
MD.19	Crops	Crops grown.
MD.19.1	Crop Category	Crop categories.
MD.48	Agricultural Season	Planting/harvest seasons (campaigns).
MD.49	Expected Yield Baseline	Baseline yield expectations.
MD.82	Yield Source	Source of yield data.
MD.83	Yield/Production Status	Status of production records.
MD.84	Seed Type	Seed varieties.
MD.85	Seed/Input Source	Source of seed/inputs.
MD.86	Fertilizer Type	Fertiliser types.
MD.87	Irrigation Type	Irrigation methods.
MD.88	Harvest Disposition	What happens to the harvest.
MD.89	Shock Impact Level	Severity of a shock/hazard.
MD.90	Harvest Record Status	Status of harvest records.
MD.96	Transport Mode	Mode of transport to each service (on foot, animal, public, private).

8.4 Programmes, eligibility and targeting

MD	Catalogue	Purpose
MD.20	Support Program	The subsidy programmes.

MD	Catalogue	Purpose
MD.21	Program Type	Category of programme.
MD.28	Benefit Model	How a benefit is structured.
MD.30	Target Group	Intended beneficiary group.
MD.36 / MD.50	Eligibility Operator	Comparison operators used in eligibility rules.
MD.42	Target Farmer Category	Farmer categories targeted.
MD.51	Field Category	Grouping of form fields.
MD.52	Program Status	Lifecycle status of a programme.
MD.53	Priority	Priority level.
MD.56	Targeting Strategy	How beneficiaries are targeted.
MD.57	Priority Model	How priority is computed.
MD.58	Benefit Item Type	Type of benefit item.
MD.59	Rule Type	Category of a determinant rule.
MD.60	Evaluation Strategy	How rules are evaluated.
MD.61	Approval Workflow	Approval routing model.
MD.66	Preliminary Eligibility Status	Initial eligibility outcome.
MD.75	Participation Status	A beneficiary's participation state.
MD.76	Exit Reason	Why a beneficiary exits a programme.

8.5 Applications, documents, decisions and appeals

MD	Catalogue	Purpose
MD.22	Application Status	Application lifecycle statuses.
MD.23	Document Type	Types of supporting document.
MD.31	Decision Type	Officer decision outcomes.
MD.32	Rejection Reason	Standard reasons for rejection.
MD.33	Request Type	Type of request.
MD.64	Document Status	Status of a submitted document.

MD	Catalogue	Purpose
MD.65	Document Rejection Reason	Reasons a document is rejected.
MD.68	Appeal Type	Category of appeal.
MD.69	Related Entity Type	What an appeal relates to.
MD.70	Original Decision	The decision being appealed.
MD.71	Appeal Grounds	Grounds for an appeal.
MD.72	Appeal Status	Appeal lifecycle statuses.
MD.73	Resolution Decision	Outcome of an appeal.
MD.74	Escalation Level	How far an appeal has escalated.

8.6 Registration, payments and channels

MD	Catalogue	Purpose
MD.18	Registration Channel	How the farmer was registered.
MD.24	Payment Method	Methods of payment.
MD.67	Mobile Money Provider	Mobile-money providers.

8.7 Inputs, equipment and supply chain

MD	Catalogue	Purpose
MD.25	Equipment / Equipment Category	Equipment items and categories.
MD.26	Training Topic	Topics for farmer training.
MD.27	Input / Input Category	Input items (seed, fertiliser…) and categories.
MD.39	Campaign Type	Type of distribution campaign.
MD.40	Distribution Model	How inputs are distributed.
MD.41	Allocation Basis	Basis for allocating inputs.
MD.43	Dealer Category	Categories of agro-dealer.
MD.44	Input Catalogue	The master catalogue of inputs.
MD.46	Input Package	Bundled input packages.

MD	Catalogue	Purpose
MD.47	Package Content	Contents of an input package.
MD.91	Input Unit	Units of measure for inputs.
MD.92	Supplier Type	Categories of supplier.
MD.93	Voucher Status	Voucher lifecycle statuses.

8.8 Funding, notifications and monitoring

MD	Catalogue	Purpose
MD.94	Donor	Funding sources/donors.
MD.34	Notification Type	Types of notification.
MD.78	Notification Channel	Delivery channels (email, SMS…).
MD.79	Notification Status	Delivery status of a notification.
MD.80	Notification Category	Category of a notification.
MD.81	Send Timing	When a notification is sent.
MD.54	Reporting Frequency	How often reporting occurs.
MD.62	Monitoring Approach	Monitoring & evaluation approach.
MD.63	Data Collection Method	How M&E data is collected.
MD.77	Satisfaction Rating	Beneficiary satisfaction scale.

9. Glossary and Acronyms

9.1 Acronyms

Acronym	Meaning
AEZ	Agro-Ecological Zone
ASMS	Agricultural Subsidy Management System (another name for the FRS)
FRS	Farmers Registration System
GL	General Ledger

Acronym	Meaning
GovStack	International standards for reusable digital-government building blocks
IDA	International Development Association (World Bank)
IM	Inputs Management
KPI	Key Performance Indicator
MAFSN	Ministry of Agriculture, Food Security and Nutrition
MD	Master Data
MM	Metamodel
MOA	Ministry of Agriculture
NID	National ID
RegBB	Registration Building Block (the GovStack component the system implements)
WAMP	Wool and Mohair / Agricultural Marketing Programme
WFP	World Food Programme

9.2 Glossary of terms

Term	Meaning
Agro-Ecological Zone (AEZ)	land classification by farming conditions.
Allocation Plan	assignment of input quantities to centres/beneficiaries before vouchers.
Appeal	a farmer's formal challenge to a decision.
Application	a farmer's request to join a programme.
Audit Trail	the log of who did what and when.
API Key	a credential for system-to-system data exchange.
Beneficiary Subledger	per-farmer budget accounting.
Budget Envelope	an allocated pot of money per programme and source.

Term	Meaning
Budget Event	one entry in the budget ledger (pre-commitment, reservation, commitment, expense, release).
Campaign / Agricultural Season	a time-bounded distribution cycle.
Case Note	a free-text note attached to a record.
Commitment	money firmly committed when a voucher is issued.
Decision	an officer's ruling on an application.
Determinant / Rule	a configurable condition the system evaluates automatically.
District	one of Lesotho's ten administrative districts.
Donor / Funding Source	where programme money comes from.
Eligibility	whether a farmer meets a programme's conditions.
Entitlement	the concrete benefit granted on approval (`EN-…`).
Expense	money actually spent, posted on redemption.
Farmer	a registered individual, keyed by National ID.
General Ledger (GL)	the complete list of budget events.
Household	a farmer's family unit.
Identity Resolver	auto-fills identity from a National ID lookup.
Input	a physical item distributed (seed, fertiliser…).
Inventory	stock on hand of an input at a centre.
Master Data (MD)	controlled lists behind drop-downs.
Metamodel (MM)	configuration tables that define a service.

Term	Meaning
National ID (NID)	the citizen identity number and master key.
Notification	an automated message on an event.
Parcel / Plot / Farm	a piece of land a farmer cultivates.
Programme / Support Programme	a subsidy scheme.
Redemption	a farmer collecting inputs; records the hand-over, decrements inventory, posts an expense.
Registry	the store of registered farmers and parcels.
Reservation	money set aside for an approved entitlement.
Resource Centre / Collection Point / Distribution Point	where inputs are collected and vouchers redeemed.
Rejection Reason	a standard reason recorded on rejection.
Roll-forward	carrying unspent budget into the next period.
Stock Transaction	a recorded stock movement.
Supplier / Agro-Dealer	a provider of inputs.
Threshold Alert	an automatic budget-utilisation warning.
Variance	allocated versus actual difference.
Voucher	an electronic entitlement to collect an input at a centre (`VCH-…`).

10. Troubleshooting and Tips

- **A list is unexpectedly empty ("Nothing found to display") even with no filters.** First clear any filters and select **Show**. If it is still empty although data should exist, your browser's cached data may be stale — clear the site's cache: in the browser, open the developer tools, go to **Application** → **Storage** and choose **Clear site data** (and unregister any service worker), then reload the page with a hard refresh (Ctrl/Cmd + Shift + R).
- **A dashboard tile or chart shows no data.** Reload the page (the dashboard refreshes on open). If it persists, clear the site cache as above.

- **“TEST MODE” is showing.** You are on a practice environment. Data here is not real and may be reset; do not rely on it for operational decisions.
- **A field will not accept your entry / the form will not save.** Check for required fields left blank and for values that must come from a master-data drop-down (you cannot type a value that is not in the list — it must first be added under **Master Data**).
- **You cannot see a module described in this guide.** Your role does not grant access to it. Contact your System Administrator if you believe you need it.
- **A voucher will not redeem.** The screen shows the exact reason — for example *insufficient stock* (reduce the quantity or wait for restock), *already redeemed*, *wrong point* (the voucher belongs to a different centre), or *expired*. Correct the cause and try again.
- **You forgot your password or cannot log in.** Contact your System Administrator to reset it. Never share accounts — the system attributes every action to the signed-in user.

This guide describes the Farmers Registration System as configured for MAFSN. Screen names and available options may evolve as programmes and master data are updated. For configuration changes, contact your System Administrator or Analyst.
